

## \* Fraud Detection &amp; Prevention

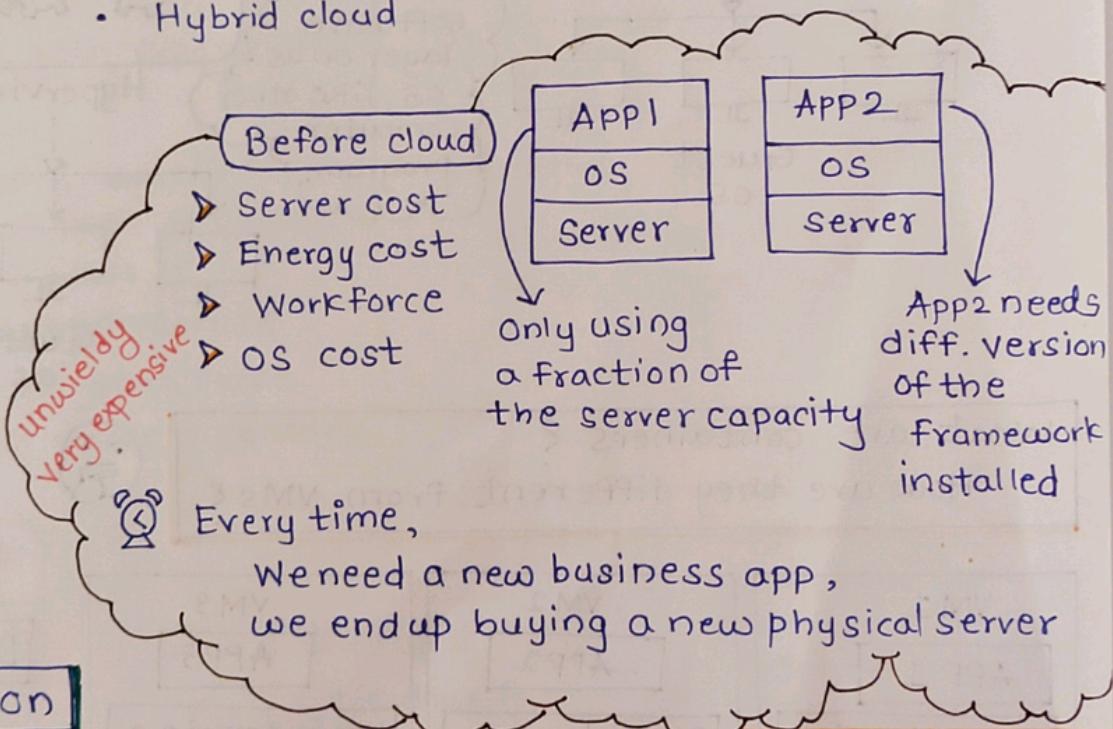

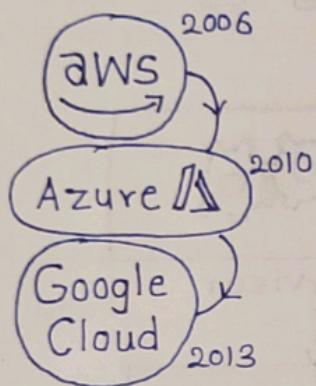

## \* Personalized Treatments

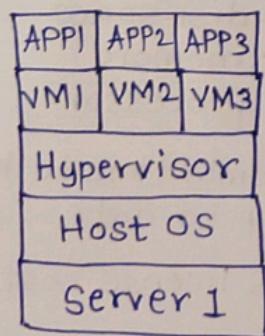

## Cloud related Service

- Infrastructure as a service (IaaS)
- Platform as a service (PaaS)
- Software as a service (SaaS)
- Private cloud
- Public cloud
- Hybrid cloud

## Virtualization

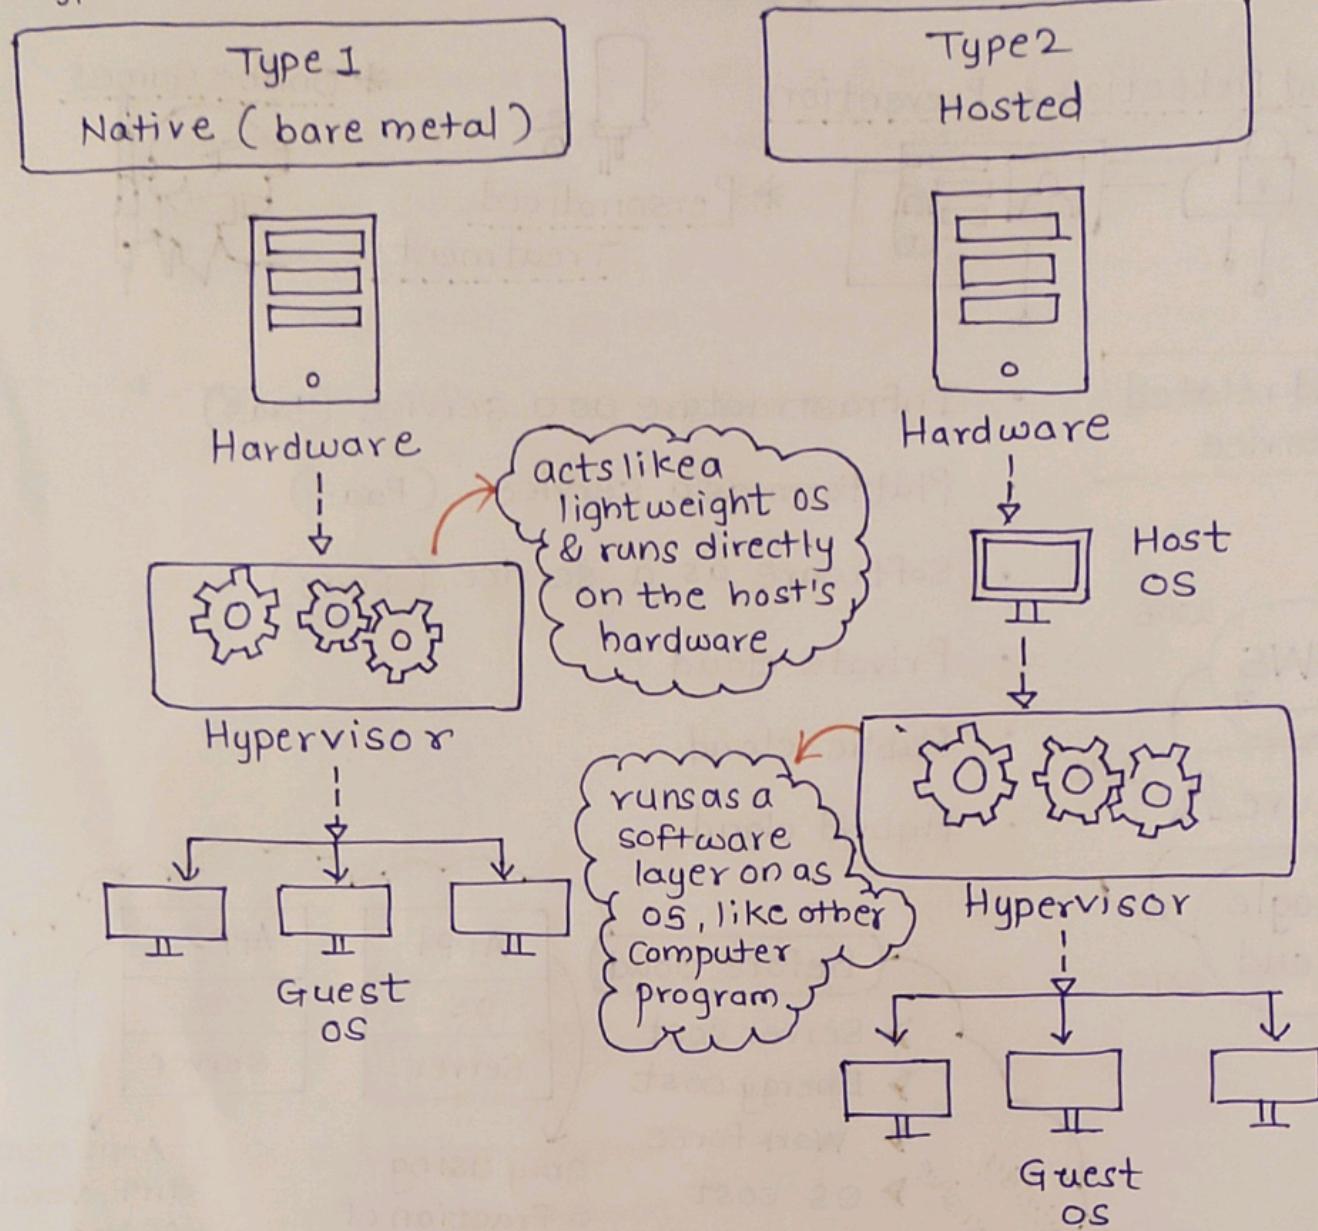

Hypervisors make it possible to use more of a system's available resources and provide greater IT mobility since the guest VMs are independent of the host hardware. This means they can be easily moved between different servers.

a hypervisor reduces :

- space
- energy
- maintenance requirements

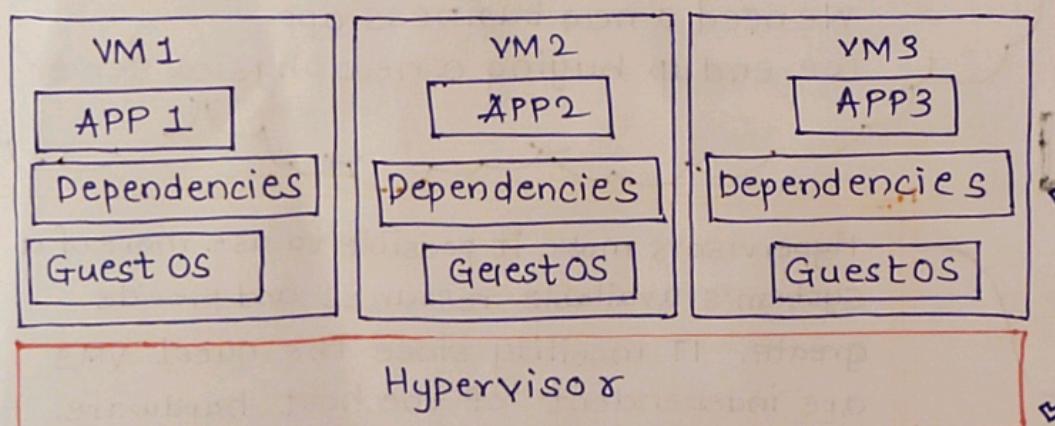

In reality, Apps are running on the same physical server but on a dedicated virtual machine.

# Hypervisor or Virtual Machine Monitor (VMM)

What are containers?

How are they different from VMs?

## Downsides

- Wasted server resources
  - disk space
  - memory
  - processor
- Admin time to keep OS up to date
- OS license cost
- VM bootup consumes time

Containers Virtualizes the operating system

- abstraction at the operating system level
- Multiple containers can run on the same machine
- can share the host operating system kernel.
- Container does not require its own operating system.
  - The amount of disk space, RAM, processor time and other server resources that are saved.
- Container packages your application code and its dependencies together.

## \* Benefits of cloud computing

### Reduce costs

- ✓ cloud reduces both capex and opex.
- ✓ organization no longer have to spend huge amount of money on physical servers, related IT infrastructure, specialized IT workforce, server rooms or data centers.

### pay as you go

You will pay for what you use.

Cloud resources are metered

### Business continuity

any crisis do not result in data loss

Setup & configure the server  
Servers connect it to UPS & n/w  
server room secured!

organizations faced with a large initial capital expenditure (Capex)

antivirus software dB server paper cooling system

Maintenance any other dependencies

- disaster recovery
- failover system

### Scalability

scale up ↑  
scale down ↓

Never run out of resources.

### Accessibility

accessed from virtually anywhere and anytime.

### Automatic Updates

### Self service

### Increased collaboration

## Risk of cloud computing

Loss of cloud data and services

Data security

Compliance and legal risks

Cost concerns

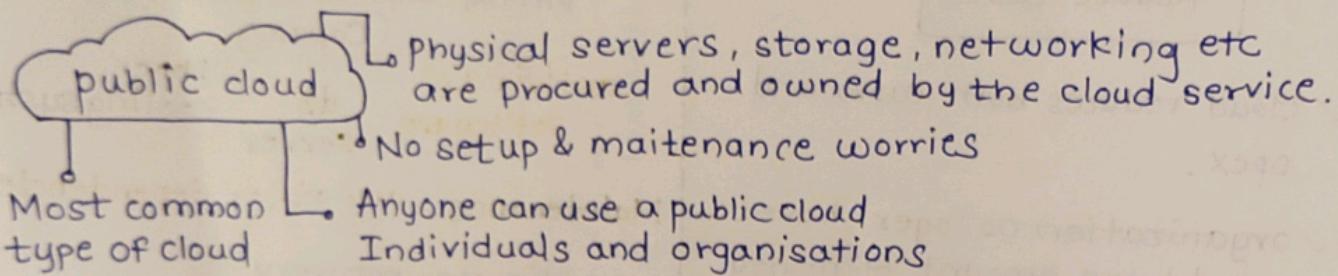

→ SLA's  
Service Level Agreement

Local and international regulations  
GDPR, HIPAA

## What is a Public Cloud.

Benefits, Limitations & Usecases.

examples → Microsoft Azure  
Amazon AWS

### Multi-tenancy

Multi organisations share cloud resources.

Manage the cloud services and resources using cloud provider web portal.

pay-as-you-go like water or electricity bills

### Benefits

- No upfront capex
- pay as you go
- No maintenance
- Highly scalable
- Highly reliable

### Limitations

Low visibility and control  
compliance and legal risks  
cost concerns

### usecase

Unlimited scalability  
varying peak demands  
Fast growing businesses  
Backup and disaster recovery solutions.

## Private Cloud

located on-premise | can be hosted by a third party service provider.

resources are used by one business or organisations.

private to a specific organisation

→ easy to customise a private cloud

→ used by government agencies financial institutions

### Benefits

Better security  
Better control  
Predictable costs  
Legal compliances

### Limitations

Limited scalability  
Huge initial capex  
Limited access

### use case

Highly regulated business  
Tech companies that require complete control  
large companies that require custom solutions.

## Hybrid Cloud

combination of private + public

Cloud Bursting

private cloud : security sensitive & business-critical operations  
public cloud : high-volume & lower security needs.

### Benefits

Best of both the worlds  
Better Control  
Cost-effective

### Limitations

Low visibility and control  
Additional complexity  
Compliance and legal risks  
cost concerns

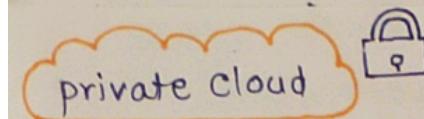

### Regular Demand

App continue to run in your own private cloud.

### Spike in Demand

Burst through to the public cloud.

### use case

The organisation that owns the private cloud must purchase the cloud hardware  
single-tenancy

Inside organization's corporate n/w

Cloud service provider (Amazon or Microsoft) provides the infrastructure.  
Multi-tenancy

Anywhere on the Internet

private cloud - Your organisation provides the hardware

Cloud service provider provides for the public cloud.  
single-tenancy + Multi-tenancy.
